

RP Assurance in Travel & Mobility

Four questions that make a wallet presentation safe to rely on

Tyche Institute · research field packet · 12 Aug 2026

Scenario: a traveller onboards to a cross-border mobility service. The wallet can present facts; the relying party still has to prove who asked, what was allowed, which transaction was verified, and what happened afterwards.

1 · Register Who is the service?	2 · Request What facts, and why?	3 · Present Is it this session?	4 · Decide What was relied on?	5 · Rights Initiated or completed?
-------------------------------------	-------------------------------------	------------------------------------	-----------------------------------	---------------------------------------

A**WHO?**

Can the traveller see—and the system prove—which service is asking?

Try: access certificate and registration identify different services.

Keep: registered/authenticated service IDs, certificate and registration versions, comparison verdict.

Limit: identity binding does not prove necessity or lawfulness.

B**WHAT / WHY?**

Are the requested facts the minimum needed for this service?

Try: request raw birth date when an age predicate suffices, or an attribute outside registered intended use.

Keep: intended-use ID, registered set, requested set, subset/purpose verdict.

Limit: a subset check does not decide legal basis.

C**THIS SESSION?**

Is the wallet answer fresh and bound to this transaction?

Try: replay with another audience, nonce, origin, holder or evaluation time.

Keep: request/response hashes, challenge and audience commitments, binding method, time, raw reason.

Limit: presentation validity does not prove later use stayed within approval.

D**WHAT HAPPENED?**

Can a later reviewer reconstruct the decision and lifecycle?

Try: mark a deletion request completed when the wallet only opened a browser or email client.

Keep: verifier/policy commitment, consumed-attribute commitment, decision reason/time, lifecycle evidence.

Limit: a receipt is not a compliance certificate or legal finding.

A useful 15-minute programme conversation

- **3 min** — choose one real service journey and its relying decision.
- **4 min** — select the failure that is hardest or most costly to diagnose.
- **5 min** — walk through one synthetic negative case and required evidence.
- **3 min** — agree a technical observation, or end unrecorded.

The one field question

Which evidence should travel across borders so that another operator can reproduce the RP decision without receiving traveller data or secret configuration?

Synthetic research aid. No traveller, booking, participant, survey or production-credential data. Not Commission-endorsed; not EUDIW/FCAF conformance. Record a participant observation only under a separate explicit permission route. Canonical structured cards and reproducibility materials are versioned by Tyche Institute.
